

COVID-19 Detection Using CT Scans: STAT453 Project Presentation

James Thomason, Steven Xia, Saniya Khullar

Context / Background

- COVID-19 has greatly impacted the entire globe
- Impoverished communities are especially at risk
 - Lack of available testing

Goal: Develop an object detection model to test for COVID-19 using a given subject's CT scan.

	TOTAL REPORTED	ON APRIL 26	14-DAY CHANGE
Cases	147.5 million+	680,472	+19% →
Deaths	3.1 million+	10,294	+7% →

Introduction

- Computed Tomography (CT) scans are a type of imaging test
 - More detailed than X-ray
 - Produces pictures of organs and chest structures
- CT scans of 742 individuals' chest cavities
 - 374 with COVID-19
 - 397 without COVID-19

Patient without COVID-19

Patient with COVID-19

Related Work

Typical – COVID-19+

- COVID-19 detection using X-Ray
 - Less expensive and more widespread than CT
 - Less detailed than CT

- Diagnosis of spine disorders using CT scans
 - Similar deep learning techniques were used
 - 3D imagery performs better than 2D imagery

Proposed Method

- Some original CT scans contained markings and label
 - Gray scale vs. non-grayscale models
 - Labels and marks were not removed
- Considered architectures:
 - LeNet-5 (only architecture with gray scale)
 - AlexNet
 - ResNet
- LeNet-5
 - 64x64 images
 - Gray scale, so images dimensions are 64x64x1

CNN Models Used

- LeNet-5

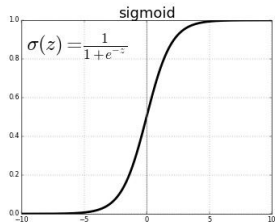

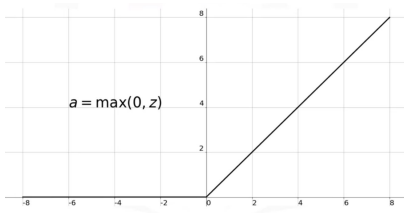

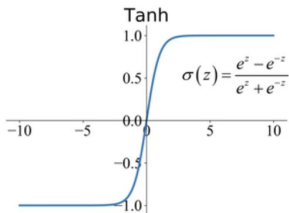

- AlexNet

Optimizers Used

	ADAM (<i>Adaptive Moment Estimation</i>)	Stochastic Gradient Descent (<i>SGD</i>)
Tunable Parameters	3 Parameters (Learning Rate, Epsilon, Momentum, RMSprop)	1 Parameter (Learning Rate)
Advantages	<ul style="list-style-type: none">• Default settings are typically optimal (usually 2nd best of other classifiers).• Tends to be the default used in Deep Learning	<ul style="list-style-type: none">• Typically needs 0 memory on the GPU (computationally friendly)• Best generalization usually (lower testing error)
Disadvantages	<ul style="list-style-type: none">• Computational Burden (requires a lot of memory for the state)• Worse generalization (higher testing error)	<ul style="list-style-type: none">• Computational Burden (requires a lot of memory for the state)• Worse generalization (testing error)
Python implementation	<pre>tf.keras.optimizers.Adam(learning_rate=0.001, beta_1=0.9, beta_2=0.999, epsilon=1e-07, amsgrad=False, name="Adam", **kwargs)</pre>	<pre>tf.keras.optimizers.SGD(learning_rate=0.01, momentum=0.0, nesterov=False, name="SGD", **kwargs)</pre>

Activation Functions	Sigmoid	Rectified Linear Unit (ReLU)	Hyperbolic Tangent (Tanh)
Activation Function			
	<p>Outputs real numbers to range between $[0,1]$</p> <p>Large - # $\rightarrow 0$</p> <p>Large + # $\rightarrow 1$</p>	<p>Outputs real #s ≥ 0</p> <p>Large - # $\rightarrow 0$</p> <p>Large + # the same</p>	<p>Outputs real numbers to range between $[-1,1]$. Centered around 0.</p>
Advantages	<p>Has an easier interpretation. Neuron does not fire when it outputs 0, but fires when it outputs 1.</p>	<p>6x improvement in convergence (compared to tanh). Become very popular</p>	<p>Scaled Sigmoid. Usually preferred to the nonlinear sigmoid function.</p>
Disadvantages	<p>May saturate and kill gradients. Neurons near</p>	<p>ReLU units could die irreversibly during training (can be delicate)</p>	<p>Has vanishing gradient problem, similar to Sigmoid</p>

Experiments:

DataLoader was used with a batch size of 32
Random Seed = 123

All CT Chest Scans were resized to 64 x 64
Then, a center crop was applied so width = height

normalization vs. no normalization: normalization yielded the best results for every architecture that was tried

Architectures:	LeNet-5, AlexNet, ResNet
Activation Functions:	Sigmoid, ReLU, Tanh
Optimizers:	ADAM, Stochastic Gradient Descent
Normalization:	With Normalization, Without Normalization

Dataset

- Source: Kaggle.com
- It can be difficult to obtain CT Scan data:
 - Costly and challenging to recruit patients and ensure safety standards and protocols are met
- Easier to obtain X-ray data
- CT Scans can be very accurate

Software / Hardware

Software:

- All models were built within Jupyter Lab Notebooks (Python 3)
- Packages: PyTorch, NumPy, Torchvision, pandas, and matplotlib packages.
- Source Code adapted from: Professor Sebastian Raschka's Code on Github (<https://github.com/rasbt/stat453-deep-learning-ss21>).
 - Standard LeNet-5, ResNet, and AlexNet architecture
 - Helper files: evaluation, train, plotting

Hardware:

- Code was executed on a laptop running windows. The code was implemented utilizing a GTX 980m nvidia graphics card.

Results and Discussion

Total Training Time: 1.06 min

Test accuracy 60.81%

Layer (type)	Output Shape	Param #
Conv2d-1	[-1, 6, 60, 60]	456
ReLU-2	[-1, 6, 60, 60]	0
MaxPool2d-3	[-1, 6, 30, 30]	0
Conv2d-4	[-1, 16, 26, 26]	2,416
ReLU-5	[-1, 16, 26, 26]	0
MaxPool2d-6	[-1, 16, 13, 13]	0
Linear-7	[-1, 120]	324,600
ReLU-8	[-1, 120]	0
Linear-9	[-1, 84]	10,164
ReLU-10	[-1, 84]	0
Linear-11	[-1, 2]	170

all params: 337,806

inable params: 337,806

-trainable params: 0

ut size (MB): 0.05

ward/backward pass size (MB): 0.56

ams size (MB): 1.29

imated Total Size (MB): 1.90

Conclusion

- Model wasn't helpful
- A similar model even with high accuracy won't help
- Time is your most valuable resource
